

# Safe Puppy Vaccination Schedules

An example of a safe puppy vaccination schedule as suggested by Dr. Pitcairn is as follows:

- From 0 week to 22 weeks - keep the puppy isolated from other dogs
- First **distemper** - 16 weeks
- First **parvo** - 20 weeks
- Second **distemper** - 24 weeks
- Second **parvo** - 28 weeks
- **Rabies** - 32 weeks

Another minimum vaccination protocol is recommended by Dr. Schultz - which is just one DAP (Distemper/Adenovirus/Parvo) at 15 to 16 weeks, followed by a simple blood titer test 2-3 weeks later, with the rabies vaccine given at about 20 weeks of age.

## Use Homeopathic Remedy *Thuja* to Prevent Vaccinosis

### [Newton Homeopathics Thuja for Dogs & Cats](#)

If you know that your dog suffers from vaccinosis (adverse reaction to a vaccine), give a dose of *Thuja* (30C) to your dog within two hours of the injection. It is also helpful in case of immediate vaccine reactions such as vomiting or diarrhea occurring within a few hours of the shot.
